Question 1 WEEK-04-01 Correct Marked out of 3.00 Flag question Alice and Bob are playing a game called "Stone Game". Stone game is a two-player game. Let N be the total number of stones. In each turn, a player can remove either one stone or four stones. The player who picks the last stone, wins. They follow the "Ladies First" norm. Hence Alice is always the one to make the first move. Your task is to find out whether Alice can win, if both play the game optimally.

**REG NO: 240701136** 

Name: Farhan

WEEK-04

**Input Format** First line starts with T, which is the number of test cases. Each test case will contain N number of stones. **Output Format** 

Print "Yes" in the case Alice wins, else print "No". Constraints 1<=T<=1000 1<=N<=10000

Sample Input and Output Input 3 1

6 7 Output Yes Yes

No **Answer:** (penalty regime: 0 %) #include<stdio.h> 1 2 🔻 int main(){ 3 int T,N,winner; scanf("%d",&T); 4 5 while(T--) { **6** ▼ scanf("%d",&N); 7 8 winner=0; 9 • while(N>0){ if(N>=4)10

11 N=4; else 12 N=1; 13 14 winner=!winner; 15 if(winner==1) 16 printf("Yes\n"); 17 18 19 else printf("No\n"); 20 21 22 return 0; 23 24 } 25 26

> 27 28

Input Expected Got 3 Yes Yes 1 Yes Yes 6 No No 7 Passed all tests! < Question 2 Correct Marked out of 5.00 Flag question

You are designing a poster which prints out numbers with a unique style applied to each of them. The styling is based on the number of closed paths or holes present in a given number. The number of holes that each of the digits from 0 to 9 have are equal to the number of closed paths in the digit. Their values are: 1, 2, 3, 5, and 7 = 0 holes. 0, 4, 6, and 9 = 1 hole.

8 = 2 holes. Given a number, you must determine the sum of the number of holes for all of its digits. For example, the number 819 has 3 holes. Complete the program, it must must return an integer denoting the total number of holes in num.

Constraints  $1 \le \text{num} \le 109$ Input Format For Custom Testing There is one line of text containing a single integer num, the value to process.

Sample Input 630 Sample Output 2 Explanation Add the holes count for each digit, 6, 3 and 0. Return 1 + 0 + 1 = 2.

Sample Case 1 Sample Input 1288 Sample Output 4 Explanation Add the holes count for each digit, 1, 2, 8, 8. Return 0 + 0 + 2 + 2 = 4.

**Answer:** (penalty regime: 0 %)

int main(){

Question **3** Correct Marked out of 7.00 Flag question The problem solvers have found a new Island for coding and named it as Philaland. These smart people were given a task to make a purchase of items at the Island easier by distributing various coins with different values. Manish has come up with a solution that if we make coins category starting from \$1 till the maximum price of the item present on Island, then we can purchase any item easily. He added the following example to prove his point. Let's suppose the maximum price of an item is 5\$ then we can make coins of {\$1, \$2, \$3, \$4, Now Manisha, being a keen observer suggested that we could actually minimize the number of coins required and gave following distribution {\$1, \$2, \$3}. According to him any item can

For test case 2, N=5. According to Manish {\$1, \$2, \$3, \$4, \$5} must be distributed. But as per Manisha only {\$1, \$2, \$3} coins are enough to purchase any item ranging from \$1 to \$5. Hence minimum is 3. Likewise, denominations could also be {\$1, \$2, \$4}. Hence answer is still 3. **Answer:** (penalty regime: 0 %) #include<stdio.h> 2 √ int main(){ 3 int n, count=0; scanf("%d",&n); 4 while (n>0) 5 6 ▼ 7 n=n/2; count++; 8 9 10 printf("%d",count); 11 return 0; 12 } 13 Input **Expected** 10 5 3 20 500 1000 10 Passed all tests! < Quiz navigation

Example Input / Output 1:

5 10 15 20 25 30 35 40 45 50

Answer: (penalty regime: 0 %)

int main(){

#include<stdio.h>

{

return 0;

int num, numodd=0;

if(num%2==1)

printf("%d", numodd);

5 10 15 20 25 30 35 40 45 50 5

while(scanf("%d",&num)>0)

numodd++;

**Expected Got** 

Given a number N, return true if and only if it is a confusing number, which satisfies the

We can rotate digits by 180 degrees to form new digits. When 0, 1, 6, 8, 9 are rotated 180

degrees, they become 0, 1, 9, 8, 6 respectively. When 2, 3, 4, 5 and 7 are rotated 180

5

**Boundary Conditions:** 

degrees, they become invalid. A confusing number is a number that when rotated 180 degrees becomes a different number with each digit valid. **Example 1:** 6 -> 9Input: 6 Output: true **Explanation:** We get 9 after rotating 6, 9 is a valid number and 9!=6. **Example 2:** 89 -> 68 Input: 89 Output: true

We get 68 after rotating 89, 86 is a valid number and 86!=89.

We get 11 after rotating 11, 11 is a valid number but the value remains the same, thus 11 is not

After the rotation we can ignore leading zeros, for example if after rotation we

**Answer:** (penalty regime: 0 %) #include<stdio.h> 1 int main(){ 2 🔻 3 int a, rem, flag=0, c=0, s=0, b; scanf("%d",&a); 4 5 b=a;while(a){ 6 ▼ 7 rem=a%10; if(rem==1||rem==6||rem==8||rem==9||rem==0) 8 9 flag++; s=s\*10+rem;10 11 a=a/10;12 C++; 13 if(flag==c) 14 **15** ▼ if(s!=b||c==1) 16 { **17** ▼ printf("true"); 18

**/** 

return 0;

printf("false");

have 0008 then this number is considered as just 8.

89 true true 25 false false Passed all tests! < Question **3** Correct Marked out of 7.00 Flag question A nutritionist is labeling all the best power foods in the market. Every food item arranged in a single line, will have a value beginning from 1 and increasing by 1 for each, until all items have a value associated with them. An item's value is the same as the number of macronutrients it has. For example, food item with value 1 has 1 macronutrient, food item with value 2 has 2

macronutrients, and incrementing in this fashion.

Here's an illustration:

2 + 3 + 4 = 9

1+3+4=8

1+2+4=7

It has the following:

among:

The nutritionist has to recommend the best combination to patients, i.e. maximum total of

macronutrients (an 'unhealthy' number), and this sum is known. The nutritionist chooses

macronutrients, on choosing items 1, 2, 3 -> the sum is 6, which matches the 'unhealthy'

Since 2 + 3 + 4 = 9, allows for maximum number of macronutrients, 9 is the right answer.

Complete the code in the editor below. It must return an integer that represents the

maximum total of macronutrients, modulo  $1000000007 (10^9 + 7)$ .

*n*: an integer that denotes the number of food items

*k*: an integer that denotes the unhealthy number

sum. Hence, one of the three needs to be skipped. Thus, the best combination is from

food items in the increasing order of their value. Compute the highest total of macronutrients

that can be prescribed to a patient, without the sum matching the given 'unhealthy' number.

macronutrients. However, the nutritionist must avoid prescribing a particular sum of

Given 4 food items (hence value: 1,2,3 and 4), and the unhealthy sum being 6

**Constraints**  $1 \le n \le 2 \times 10^9$  $\cdot 1 \le k \le 4 \times 10^{15}$ Input Format For Custom Testing The first line contains an integer, n, that denotes the number of food items. The second line contains an integer, k, that denotes the unhealthy number.

Sample Input 0

**Sample Output 0** 

2

2

3

**Explanation 0** The following sequence of n = 2 food items: 1. Item 1 has 1 macronutrients. 1 + 2 = 3; observe that this is the max total, and having avoided having exactly k = 1

2 macronutrients.

**Sample Input 1** 

2

1

2 **Explanation 1** Cannot use item 1 because k = 1 and  $sum \equiv k$  has to be avoided at any time. 1. Hence, max total is achieved by sum = 0 + 2 = 2. 2.

Sample Case 2

**Sample Input 2** 

3

3

**Sample Input For Custom Testing** 

**Sample Output 1** 

**Sample Output 2** 5 **Explanation 2** 2 + 3 = 5, is the best case for maximum nutrients.
